1 Product description and features

SWIR series is a USB3 / GigE / 10G / CameraLink interface short-wave infrared camera which adopts SONY or nationally produced InGaAs sensor. This camera has high quantum efficiency and high sensitivity, suitable for many common SWIR applications in different industrial segments.

- Semiconductor industry: Solar cell and chip inspection
- Agriculture: Spectral remote sensing applications by multi-rotor aircraft
- Recycling industry: Material sorting of plastics, waste and other materials
- Medical Imaging and Research: Hyperspectral and multispectral imaging
- Food industry: Quality inspection and classification
- Beverage industry: Liquid level detection in opaque containers
- Packing: Sealed inspection
- Glass industry: High temperature glass fluoroscopy defect detection
- Printing: Insight into hidden features
- Video surveillance: Visual enhancement (e.g. smoke perspective)
- Security: Detection of counterfeit goods, such as currency, wigs or skin

The basic features of SWIR series are as follows:

- The 400-1700nm version uses the SONY SenSWIR InGaAs sensor
- The 900-1700nm version uses the nationally produced InGaAs sensor
- The resolution covers 5MP-0.33MP
- Provide cooling version or uncooled version
- Precise temperature control, the temperature difference can reach 10-25 degrees Celsius
- Spectral response range: 400nm-1700nm/ 900-1700nm
- 15um /5um / 3.45um pixel size
- Global shutter
- USB3 / GigE / 10G / CameraLink / analog AV and other data interfaces
- Higher 14-bit ADC
- 4Gb memory
- Support external IO trigger control
- High framerate exceeding official parameters
- Support field update firmware
- Accept OEM custom development

IMX992-AABA(TS) vs IMX990-AABA(MP)

*NOTE

- The data for B were measured at TS. It is possible to change at ES/MP.
- This data is reference for understanding of IMX992-AABA Quantum Efficiency characteristics.
It is NOT guarantee of IMX992-AABA characteristics.
- Data acquisition conditions.
 - $T_j = 15 \text{ } ^\circ\text{C}$
 - Characteristics in the package status
 - Constant photon number at each wavelength

5 Camera functions and features

5.1 10G / 5G / 2.5G / GigE camera specification

The GigE camera requires the host card's jumbo frame mode to be enabled to achieve the highest frame rate.

Ensure that the IP addresses of the GigE camera and PC network card are in the same network segment.

Support multiple cameras to work simultaneously and synchronize acquisition through external trigger interfaces.

5.2 CameraLink camera specification

The Cameralink camera transfers data using Geometry_1X4_1Y mode, the 12-bit camera transfers data in Medium mode, and the 14-bit camera transfers data in Full mode.

5.3 Camera operation mode

Camera operation mode support: Video Mode or Trigger Mode.

Camera Trigger Mode support: Soft Trigger Mode(Software) or External Trigger Mode(Isolated input, GPIO0, GPIO1, Counter or PWM).

5.4 Bit depth and ROI control

SWIR series has a built-in 12bit t / 14bit ADC, and the camera also support hardware ROI. The smaller the ROI size, the faster the frame rate.

5.5 Bandwidth and precise frame rate control

5.5.1 Bandwidth

SWIR series support bandwidth adjustment from 1% to 100%. As shown in Figure 8, the camera is with 100% bandwidth by default, and you can drag the slider to set the desired bandwidth.

Figure 8 Bandwidth and precise frame rate settings

5.5.2 Precise frame rate control

SWIR series support precise frame rate control. The frame rate range will vary based on bandwidth, bit depth, resolution, ROI. As shown in Figure 8, the current frame rate can be set by dragging the Bandwith or Frame Rate slider bar left or right.

5.6 DDR3 buffer

SWIR series has a built-in 512MByte (4Gb) DDR3 buffer, which can effectively improve the stability of USB3 / Cameralink / GigE data transmission and ensure that the camera does not lose frames when working.

5.7 Binning

SWIR series support additive or averaged 1x1 to 8x8 digital binning, and averaged 1x1 to 2x2 hardware binning. Hardware binning can achieve higher frame rates than software binning.

5.8 DC12V power supply and cooling system

When the DC12V power supply is plugged in, both the camera cooling system and the imaging system use a unified 12V power supply.

For USB camera, when the DC12V power supply is disconnected, the camera cooling system stops working, and the imaging system will automatically switch to the USB 5V power supply and the camera can work normally in passive cooling mode.

For GigE and CameraLink camera, when the DC12V power supply is disconnected, the camera cant work.

The cooling system of SWIR series has a built-in or external TEC cooling for the sensor. It uses an external heat dissipation structure and a fan to assist heat dissipation. The working temperature can be adjusted to a specific value, and the effective cooling temperature can be lower than the ambient temperature by 10 - 25 °C. The efficient cooling system guarantees extremely low dark current levels.

The TEC system is controlled by PID algorithm, so that the TEC can be accurately adjusted to the target temperature, and the temperature deviation is 0.1°C.

5.9 Camera performance analysis

The performance of the camera can be evaluated by [e-/ADU](#), [Readout Noise](#), [Full Well](#) and [Dynamic Range](#).

e-/ADU: The electron signal of the CCD/CMOS camera is converted into a digital signal through a series of circuits such as readout, amplification, and analog-to-digital converter. The converted digital signal unit is called [ADU](#). The conversion factor is e-/ADU.

Readout Noise: Readout noise is the most important reference indicator for measuring camera performance. Low readout noise usually means better signal-to-noise ratio and better image quality. Readout noise occurs when electrons go through steps such as analog-to-digital conversion, amplification, and processing to create an image during readout.

Full Well: The maximum capacity of how many electrons could be held by each pixel of the camera. Under the same conditions of noise and A/D conversion, the larger the full-well charge capacity of the sensor, the wider the dynamic range.

Dynamic Range: Dynamic range is specified as the maximum achievable signal divided by the camera noise, where the signal strength is determined by the full-well capacity and noise is the sum of dark and readout noises.. Dynamic range represents the camera's ability to display the brightest and darkest parts of an image and how much there is variation between the two. There may be one part of an image that is completely black and another part that is completely saturated.

For SWIR series, when describing camera performance, [Gain Value](#) In xxx% mode, here use xxx as the x - axis ([Gain Value](#))

$$\text{Rel Gain}(dB) = 20 * \log_{10}[\text{xxx}(\text{Gain Value})/100]$$

$$\text{xxx}(\text{Gain Value}) = 100 \times 10^{(\text{Rel Gain}(dB)/20)}$$

For details about the performance of the camera, see the parameters of each model or series.

5.10 Lens design guidelines

Information on lens selection is provided below.

The sensor imaging and the lenses are shown in Figure 9 and Figure 10.

5.12 RG version description

SWIR1300KMB-UMV and SWIR330KMB-UMV are available in RG (de-glazing) versions, as shown in the figure below.

5.13 C0 version description

SWIR331KMB-U700 and SWIR331KMB-G125 are available in C0 (Class0) versions with support for long exposure mode and deep cooling to -45 degrees.

8.3 I/O electrical characteristics

8.3.1 Opto-isolated input circuit (line0)

In the I/O control of the camera, the opto-isolated input circuit is shown in Figure 40.

Figure 42 Opto-isolated input circuit

Logic 0 input level: 0~2.2VDC (OPTO_IN pin)

Logic 1 input level: 3.3~24VDC (OPTO_IN pin)

Maximum input current: 30mA

When the input level is between 2.2V and 3.2V, the circuit operation state is uncertain, please do not let SWIR camera work within this voltage range.

Figure 43 Input logic levels

Input rise delay (TDR): 6us

Input fall delay (TDF): 6us

8.3.2 Opto-isolated output circuit (line1)

In the camera I/O control, the opto-isolated output circuit is shown in Figure 42.

Figure 44 Optocoupler output circuit

The opto-isolated output maximum current is 30mA.

Figure 45 Output logic levels

The electrical characteristics of the opto-isolated output (external voltage 5V, external resistor 1K) are shown in Table 80.

Table 8- 6 Opto-isolated output signal's electrical characteristics

Parameter name	Parameter notation	Parameter value
Output logic low	VL	742mV
Output logic high	VH	4.134V
Output rise time	TR	4us
Output fall time	TF	1.8us
Output rise delay	TDR	12us
Output fall delay	TDF	2us

The output of the corresponding output current and VL when using different voltages and resistors in external circuit are shown in Table 81.

Table 8- 7 Opto-isolated output logic's low levels parameters

External voltage	External resistor	VL	Output current
3.3V	1KΩ	510mV	2.82mA
5V	1KΩ	742mV	4.31mA
12V	2.4KΩ	795mV	4.68mA
24V	4.7KΩ	850mV	4.97mA

8.3.3 Input and output I/O circuit (line2/line3)

The non-isolated configurable input and output I/O circuits are shown in Figure 44 and Figure 45.

1. Line2/line3 is set as input pin

Logic 0 input level: 0~0.6VDC (DIR_GPIO0/DIR_GPIO1 pins)

Logic 1 input level: 2.0~24VDC (DIR_GPIO0/DIR_GPIO1 pins)

Maximum input current: 25mA

When the input level is between 0.6V and 2.0V, the circuit action state is uncertain, please avoid the input voltage range working in this range.

Figure 48 Input logic levels

To prevent damage to the GPIO pins, please connect the pin GND first, and then input voltage to the Line2 pin.

Input rise delay (TDR): 0.02us

Input fall delay (TDF): 0.02us

2. Line2/line3 are set as output pins

The maximum current allowed through this pin is 25mA.

When the ambient temperature is 25 degrees Celsius, the relationship between the external voltage, resistance and low-level voltage output is shown in Table 82.

Table 8-8 Non-isolated output Logic's low level parameters

External voltage	External resistor	VL (GPIO)
3.3V	1KΩ	0.11V
5V	1KΩ	0.167V
12V	2.4KΩ	0.184V
24V	4.7KΩ	0.385V

The external pull-up voltage is 5V, the pull-up resistor is $1K\Omega$, and the GPIO is configured to output the logic level and electrical characteristics as shown in Figure 47.

9 ToupView Application

9.1 Application installation

In terms of software, customers are welcome to visit our website:<https://www.touptekphotonics.com/> to download the latest ToupView. SWIR series can also be used with ASCOM, DirectShow interface. If the third-party software is compatible with these interfaces, customers can also download software drivers from our website and install them into the third-party software.

9.2 Introduction to ToupView

ToupView is a professional software that integrates camera control, image acquisition and processing, image browsing and analysis functions. ToupView has the following characteristics:

- x86: XP SP3 and above ; CPU support SSE2 and above
- x64: Win7 and above
- Support video mode and Trigger Mode (Raw format or RGB format)
- Automatic capture and quick recording capabilities
- Support multiple languages
- Hardware ROI and digital binning capabilities
- Rich image processing functions, such as image stitching, real-time overlay, flat field correction, dark field correction, etc.
- Support all TouTek cameras

9.2.1 User interface design

- The menus and toolbars are properly set to ensure quick operation
- Professionally integrated with 5 sidebars - Camera, Folders, Undo/Redo, Layers, Measure
- Comfortable operation method (double-click or right-click context menu)
- Detailed help manual

Figure 50 ToupView video window

9.2.2 Professional Camera Control Sidebar

Capture & Resolution	Set up live and still capture, snap images, or record video
Exposure & Gain	Auto exposure (preset exposure target value), manual exposure (exposure time can be manually entered and set by slider); gain up to 5 times
White Balance	Advanced one-click smart white balance settings, and you can adjust white balance by manually setting color temperature and color
Color Adjustment	Color, saturation, brightness, contrast, gamma initial high-speed adjustment function
Frame Rate Control	For different computer and USB performance, the camera can be super compatible by adjusting the frame rate
Flip	Select "Horizontal" or "Vertical" to adjust the sample orientation to ensure the same orientation as the visual system
Sampling	Neighborhood averaging can improve the signal-to-noise ratio of the video stream; while the sampling extraction mode can ensure the sharpness of the video stream. Support histogram expansion of video stream, image negative and positive switching, grayscale calibration, and sharpness factor calculation to facilitate video focusing
Bit Depth	8, 12-bit switching, 8-bit is the basic Windows image format. 12-bit has higher image quality but reduces frame rate
Roi	ROI, Region of interest. This function can set the ROI value of the video window. After the ROI group is expanded, a rectangular box will appear in the middle of the video window, and the ROI can be changed. The mouse can adjust the size of the ROI. If there is no problem with the ROI, click "Apply" to set the video to the size of the ROI, and the default value will be restored to the original size.
Dark Field Correction	To enable darkfield correction, you should first capture a field image, then click Enable. Check Enable to enable darkfield correction. Uncheck it to disable darkfield correction
Cooling	Set TEC Target Temperature, fan on/off
Parameter Save	Load, save, overwrite, load, export custom camera panel controls (including calibration information, exposure parameters and color settings information, etc.)

9.2.3 Professional and practical image processing functions

Video Function	Various video professional processing functions: video broadcasting, timing capture, video recording, video watermarking, watermark mobile alignment, watermark rotation alignment, video grid overlay, video measurement, video scaling, gray scale calibration, video high dynamic (HDR), video depth of field extension, video image stitching, video scale, date, etc.
Image Processing and Enhancement	Image contrast control and adjustment, image denoising, various image filtering algorithms, image mathematical morphology algorithms, image rotation, image scaling and image printing, etc.
Image Overlay	The TouView image overlay denoising function introduces advanced image matching technology. Users only need to record a short video of the image to be superimposed, and they can superimpose and output high fidelity in the case of displacement, rotation and magnification change between multiple frames of the video. images, easy to use

Figure 51 Image overlay denoising

9.2.4 Super compatibility

Camera Video Interface	Provide Twain, DirectShow, Labview, SDK installation package (native C++, C#)
Supported Operating Systems	Compatible with Microsoft® Windows® XP / Vista / 7 / 8 / 10 / 11(32 & 64 bit), Mac OSX, Linux
Language Support	Language support can be added manually, currently support English, Simplified Chinese, Traditional Chinese, German, Japanese, Russian, French, Italian, Polish, Turkish

9.2.5 Basic hardware requirements

PC Basic Configuration Requirements	CPU: Intel Core 2.8GHz or higher RAM: 2GB or more
-------------------------------------	--

	USB Port: USB3.0 / USB 2.0
	Monitor: 17" or higher
	CD-ROM

9.3 Trigger Mode and its Configuration

9.3.1 Video mode and Trigger mode

The trigger function can be found on the [Capture & Resolution](#) group on the [Camera Sidebar](#) in ToupView. When the camera is opened, it is in [Video Mode](#) as shown in Figure 50 on the left. In [Video Mode](#), [Auto Exposure](#), [Exposure Target](#), [Exposure Time](#) and [Gain](#) can be set. One can switch to [Trigger Mode](#) by checking the [Trigger Mode](#) check box.

Figure 52 Video Mode and Trigger Mode on the Capture & Resolution group in ToupView

After the [Trigger Mode](#) is checked, the [Capture & Resolution](#) group will switch to [Trigger Mode](#) as shown in Figure 50 on the right. Where, the [Trigger Source](#), [Exposure Time](#), [Gain](#), [Single](#), [Loop](#), [Multiple](#), [Frame Box](#), and [Options](#) can be set.

9.3.2 Trigger Sources and their capture style

The [Trigger Source](#) can be any external input signal inputted into the camera which is called [Hardware \(Trigger Source\)](#), it can also be a command from the application which is called [Software \(Trigger Source\)](#). For the [Software Trigger Source](#), it can be [Single](#), [Loop](#), [Multiple](#), or [Sequence](#) style. Figure 51 shows the possible [Trigger Sources](#). Table 84 shows the designed [Trigger Source](#) descriptions and possible capture styles for ToupTek camera.

Figure 53 Possible Trigger Sources

Table 9- 1 Description of possible Trigger Sources and their capture styles

Trigger Source	Description
Isolated input	Logic 0 input level: 0~2.2VDC; Logic 1 input level: 3.3~24VDC; Maximum input current: 30mA;
GPIO0	Logic 0 input level: 0~0.6VDC (DIR_GPIO0/DIR_GPIO1 pins); Logic 1 input level: 2.0~24VDC (DIR_GPIO0/DIR_GPIO1 pins); Maximum input current: 25mA; If GPIO0 is chosen as Trigger Source , it should be configurated as Input in the GPIO Mode 's Options>IO Control page;
GPIO1	Logic 0 input level: 0~0.6VDC (DIR_GPIO0/DIR_GPIO1 pins);

	<p>Logic 1 input level: 2.0~24VDC (DIR_GPIO0/DIR_GPIO1 pins); Maximum input current: 25mA; If GPIO1 is chosen as Trigger Source, it should be configured as Input in the GPIO Mode's combo box on the Options>IO Control page;</p>
Counter	<p>Counter refers to the operation mode in which the camera can divide the frequency of the external input trigger signal through the preset Counter Value and perform image acquisition according to the customer's logic. For example, when the counter value(<input type="text" value="3"/> [1,1023]) is set to 3, the camera needs to receive 3 trigger signals to trigger once;</p>  <p>When Counter is chosen in Trigger Source combo box in the Capture & Resolution group, the Counter Source can be Isolated input, GPIO0 or GPIO1 which can be chosen on Options>IO Control page; If GPIO0 or GPIO1 is chosen in the Counter Source combo box on Options>IO Control page. It should be configured as Input in the GPIO Mode combo box; Check Options>IO Control page's Line Select related items and Counter related items for details;</p>
PWM	<p>PWM refers to the operation mode in which the camera exposure time is controlled by the input trigger signal's pulse width;</p>  <p>PWM Trigger Source can be Isolated input, GPIO0 or GPIO1. If GPIO0 or GPIO1 is chosen in the PWM Source combo box on the Options>IO Control page, it should be configured as Input in the GPIO Mode combo box; Check Options>IO Control page's Line Select related items and PWM related items for details;</p>
Software	<p>When Software trigger is chosen, the client software can send the command through USB3.0 to trigger, acquire and transfer images, In ToupView, Single, Loop, Multiple, or Sequence can be used to send the Software trigger command; If the Plan or Hardware is chosen in the Type combo box on the Options>Sequence page, the Multiple button will switch to Sequence button and the camera will use the Exposure Time and Gain in the Sequence table on this page one by one to capture the specified frames. Check Single, Loop, Multiple, or Sequence on Capture & Resolution group for the Software capture operations; Check Options>Sequence page and Options>Advanced page for the related Sequence and Software capture setup options;</p>
Single	<p>When Single is clicked, the camera will start to capture the image. At the same time the Single button will switch to Stop button. Clicking Stop button to stop the current Single capture operation, the Stop button will switch to Single button again for the next capture operation; Note: 1) The captured frames will always Show in the video window to prevent too many captures; 2) Enabled when Software in the Trigger Source combo box is chosen or Always enable software trigger checkbox is checked on the Options>Advanced property page;</p>
Loop	<p>When Loop is clicked, the camera will start to capture the image continuously and the Loop button will switch to Stop button. Clicking Stop button to stop Loop captures and the Stop button will switch to Loop button for the next Loop capture operation; Note: 1)The captured frames will always Show in the video window to prevent too many captures; 2)Enabled to capture continually when Software in the Trigger Source combo box is chosen or Always enable software trigger checkbox is checked on the Options>Advanced property page;</p>
Multiple	<p>Multiple refers to the operation mode in which the camera receives Software trigger signal or command and export multiple frames of images. An edit box with spin(we call it Frames Box) is designed and affiliated to the Multiple button (<input type="text" value="3"/> [1,65535] Options...) for the setting of the frames to be captured; The Frames Box can be set in the range of 1~65535. If the Frames Box is 3, a three-frame image will be captured and exported;</p>  <p>Note: 1)Multiple capture is enabled to capture continually when Software in the Trigger Source combo box is chosen; 2) Multiple capture is enabled when Always enable software trigger is checked on the Options>Advanced property page, no matter whether Trigger Source is Software or Hardware on the Capture & Resolution group;</p>

	<p>3) If the Plan or Hardware is chosen in the Type combo box on the Options>Sequence page, the Multiple button will switch to Sequence button and the camera will use the Exposure Time and Gain in the Sequence table on this page. The captured frames will be displayed either in Show in the video window, or Show in a new window or Save to disk which can be specified on Options>Output page;</p>
Sequence	<p>When Sequence is clicked, the camera will start to capture the image until the specified frames in the Frames Box are captured. At the same time the Sequence button will switch to Stop button. Clicking Stop button will stop the current Sequence capture and the Stop button will switch to Sequence again for the next Sequence capture operation;</p> <p>Note: 1) Switched from Multiple to Sequence to capture the specified frames in the edit box with spin(Frames Box) when Plan or Hardware in the Type combo box is chosen on the Options>Sequence property page;</p> <p>2) If the Plan or Hardware is chosen in the Type combo box on the Options>Sequence page, the Sequence button will be enabled and the capture will use the Exposure Time and Gain in the Sequence table list below one by one on the Options>Sequence page;</p> <p>3) If the Plan or Hardware is chosen in the Type combo box on the Options>Sequence page and Always enable software trigger is checked on the Options>Advanced property page, the Sequence button will not switch to Multiple button and will be enabled only when the still in Sequence enable</p> <p>4) If the Plan is chosen in the Type combo box on the Options>Sequence page and the Software is chosen in the Trigger Source combo box, the Sequence button will be enabled.</p> <p>5) If the Hardware is chosen in the Trigger Source combo box, the Sequence button will be disabled, but the Frame Box will still be enabled and the Sequence will switch to the Hardware Sequence capture. One Hardware trigger signal will capture the specified frames on the Frame Box using the Exposure Time and Gain in the Sequence table on Options>Sequence page;</p> <p>6) Check Options>Sequence page for the related Sequence setup options;</p>

9.3.3 The trigger capture and IO Control configurations

Figure 54 Options>Output page

The **Trigger Source** can be **Isolated input**, **GPIO0**, **GPIO1**(when configured as input), **Counter**, or **PWM** which can be configured on the **Options** property sheet. Also the camera's **Isolated output**, **GPIO0** or **GPIO1**(can be

configured as [Output](#)) can be used as [Output](#) or [UART \(GPIO0, GPIO1 only\)](#) applications. All of these configurations can be realized on the [Options](#) property sheet described in Table 85 below.

About the captured file operation style, one can find it on the [Option>Output](#) page;

About the [Sequence](#) setup, one can find it on the [Option>Sequence](#) page;

About the camera pin [IO Control](#) style, one can find it on the [Options>IO Control](#) page;

About the [Always enable software trigger](#) and [UART](#) setup, [Shutter Mode](#), and [Exposure Active Mode](#), one can find it on the [Options>Advance](#) page.

Pages	Items	Descriptions
Output page	Output Destination	<p>Used to set the captured frame's Output destination, can be Show in the video window, Show in a new window or Save to disk;</p> <p>When Save to disk is checked, the  button will be enabled clicking it to choose the Base directory, clicking the Sub combo box's dropdown button to choose the Sub directory;</p> <p>The File Name Format, File Prefix, File Type, and even The sequence begin with can be chosen, set, or defined.</p> <p>Note:</p> <ul style="list-style-type: none"> 1)Valid only for Sequence or Multiple capture setup; 2)For Single or Loop capture, the captured image will be always displayed on the video window;
Sequence page	Type	<p>Disable: If the Disable button is chosen in the Type combo box on the Options>Sequence page, the Sequence button on the Capture & Resolution page will switch to Multiple button;</p> <p>Plan: 1)If Plan is chosen in the Type combo box on the Options>Sequence page, the Multiple button on the Capture & Resolution group will switch to Sequence button; 2) If the Software Trigger Source is chosen in the Capture & Resolution group or the Always enable software trigger is checked on the Options>Advanced property page, the Sequence button will be enabled After the Software trigger signal is arrived(By clicking Single, Loop, or Sequence button), the camera will capture frames specified in the edit box with spin    (we call it Frames Box) affiliated to the Sequence button; The whole captures will use the Exposure Time, Gain and Delay in the Sequence table list under   one by one by the software;</p> <p>3) If the Disable button is chosen in the Type combo box on the Options>Sequence page, the Sequence button on the Capture & Resolution page will switch to Multiple button;</p> <p>4) The Sequence button will be enabled only when a) the Plan in the Type combo box is chosen on the Options>Sequence page and b) he Software Trigger Source is chosen in the Capture & Resolution group or c) Always enable software trigger is checked on the Options>Advanced property page;</p> <p>Hardware: 1) if Hardware is chosen in the Type combo box on the Options>Sequence page, the Multiple button on the Capture & Resolution group will switch to Sequence button and will be disabled for Hardware trigger. But users can still set the frames number in the Frame Box on the Capture & Resolution group; 2) After the Hardware trigger signal arrives, the camera will capture frames specified in the edit box with spin    (we call it Frame Box) affiliated to the Sequence button; The whole capture will use the Exposure Time, Gain (Delay is not used) in the Sequence table list under   one by one but stored in the camera hardware for the quick operation;</p> <p>3) If the Disable button is chosen in the Type combo box on the Options>Sequence page, the Sequence button on the Capture & Resolution page will switch to Multiple button;</p> <p>4) The Sequence button is always disabled if a) The Hardware is chosen in the Type combo box on the Options>Sequence page and b)the Hardware Trigger Source is chosen in the Capture & Resolution group;</p> <p>5) The Sequence button will be enabled if a) the Software Trigger Source is chosen in the Capture & Resolution group or b) the Always enable software trigger checkbox is checked on the Options>Advanced property page, in this case, both the Plan and Hardware Sequence capture are supported;</p>
	Number	The possible Sequence (capture) frames to be captured. If the Number is larger than the Sequence Number in the Frames Box on the Capture & Resolution group, the other Indices will be executed at the next Sequence operation one by one recycled;
	Index	The order of the Number group;
	Exposure Time	The camera Exposure Time for the specified capture Index in the Sequence capture;
	Gain	The camera Gain for the specified capture Index in the Sequence capture;
	Delay	The Delay time for the specified capture Index in the Plan Sequence capture(Valid for Plan Sequence capture only);

	Preset	Choosing Save to save the current Sequence table 's settings; Clicking Management to Rename the saved Sequence table 's setting files or Remove them from the Management list;
IO Control page	Line Select	Choosing which line to set. Can be Isolated input , Isolated output , GPIO0 or GPIO1 et al ;
	GPIO Mode	To configure whether the line selected in Line Select is for Input or Output . Only GPIO0 or GPIO1 can be configured as either Input or Output ; If Isolated input or Isolated output is chosen, the GPIO Mode will be specified as Input or Output (Not configurable) respectively;
	Format	Specify the current selected signal's Format in the Line Select combo box, can be Opto-coupled(Isolated input, Isolated output) or TTL (GPIO0 or GPIO1) for clarity(Unconfigurable);
	Debouncer Time	Since there may be a glitch in the external trigger input signal if it directly enters into the internal logic circuit of the camera, it will cause false triggering, so the input trigger signal should be debounced. In addition, the effective pulse width of the trigger signal input by the user should be greater than the Debouncer Time , otherwise, the trigger signal will be ignored; When Isolated input , GPIO0 or GPIO1 is chosen in the Line Select combo box and GPIO0 or GPIO1 is configured as Input in the GPIO Mode combo box, the Debouncer Time will be enabled for the user to input the Debounce Time between 0 to 20000us;
		
	Input Activation	When Isolated input , GPIO0 or GPIO1 is chosen in the Line Select combo box and GPIO0 or GPIO1 is configured as Input in the GPIO Mode combo box; The Input Activation combo box will be enabled to configure the Input Activation as either Rising Edge or Falling Edge ;
	Trigger Delay	When Isolated input , GPIO0 or GPIO1 is chosen in the Line Select combo box and GPIO0 or GPIO1 is configured as Input in the GPIO Mode combo box, the Trigger Delay will be enabled for the user to input the Trigger Delay time between 0 to 5000000us; If the Trigger Delay time is set to 1000000us, the camera will wait for 1s to capture the image after receiving the trigger signal;
	Output Mode Frame Trigger Wait Exposure Active Strobe User Output	When Isolated output , GPIO0 or GPIO1 is selected in the Line Select combo box and GPIO0 or GPIO1 is configured as Output in the GPIO Mode combo box, the Output Mode will be enabled. It can be Frame Trigger Wait , Exposure Active , Strobe , or User Output . The chosen mode can be used for diversified applications; The Frame Trigger Wait signal is pulled low at the start of exposure and pulled high when the last frame of data is read out. The trigger signal input by the user should be in the valid period. If the user inputs a trigger signal when the signal is low, the trigger signal input at this time will be ignored. The following example is the case when Burst Count = 2, as shown below;
		
		Exposure Active: when this signal is high, it means the sensor is exposing. This signal can be used to control an external mobile device to remain stationary or move at low speed while the camera is at exposure. The timing diagram of the exposure valid signal is shown below;

	<p>When the relative position of the camera and the object to be photographed changes, you can refer to Exposure Active signal to prevent the captured image from being affected by movement and focus adjustment during the exposure process;</p> <p>When Strobe is chosen, Strobe Delay Mode, Strobe Delay Time, Strobe Duration will be enabled;</p> <p>When User Output is chosen, User Value will be enabled. lines3, line2, line1 are the combination of GPIO1, GPIO0 and Isolated output respectively. If User Value is 001, then line GPIO1 and GPIO0 will be disabled and Isolated output will be enabled;</p> <table border="1"> <tr> <td style="text-align: center;">UserOutput</td> <td style="text-align: center;">1</td> <td style="text-align: center;">0</td> <td style="text-align: center;">0</td> </tr> <tr> <td style="text-align: center;">Value:</td> <td colspan="3"></td> </tr> <tr> <td style="text-align: center;">Line:</td> <td style="text-align: center;">line3</td> <td style="text-align: center;">line2</td> <td style="text-align: center;">line1</td> </tr> </table>	UserOutput	1	0	0	Value:				Line:	line3	line2	line1
UserOutput	1	0	0										
Value:													
Line:	line3	line2	line1										
Output Inverter	When Isolated output , GPIO0 or GPIO1 is selected in the Line Select combo box and Output is chosen for GPIO0 or GPIO1 in the GPIO Mode combo box, the Output Inverter will be enabled to configure the current selected line's output as either inverted or not(Yes or No).												
Strobe Delay Mode	Strobe can be used to control external devices such as the strobe, and the effective level duration, delay time, and pre-delay time of the strobe signal can be set; When the Output Mode is Strobe , Strobe Delay Mode will be enabled. It can be pre-delay or delay ;												
Strobe Delay Time	When exposure starts, the strobe does not take effect immediately, and the output is delayed according to the value set by Strobe Delay Time which is between 0 to 5000000us. The Strobe Delay Mode can be pre-delay or delay ; It is described below; pre-delay : delay : The high level duration of the strobe is determined by the Strobe Duration which is between 0 to 5000000us as shown below;												
Strobe Duration													
User Value	Users can input a value at User Value edit box with spin to control the line as disable or enable. Enabled when User Output is chosen in the Output Mode combo box. The logical value 0 or 1's combination of GPIO1 (line3),												

	GPIO0 (line2) and Isolated output (line1); When the output mode is selected as User Output , the user can input a value at User Value edit box to control the corresponding line output with 0 or 1; The value here is only valid for the lower three bits of a binary. For example, when line 1 and line 3 are set to User Output mode, and its User Value is set to 4 (b100), then line 3 outputs 1, and line 1 outputs 0, as shown below.
	
Counter Source	When Counter is chosen in the Trigger Source combo box in the Capture & Resolution group, the Counter Source can be chosen from Isolated input , GPIO0 or GPIO1 in this combo box on the Option>IO Control page;
Counter Value	The Counter Value is used to divide the frequency of the external input trigger signal when the Counter Trigger Source is chosen in the Capture & Resolution group; See Counter in Table 84 for detail;
Counter Reset	Click Reset button can clear the current counting process and begin a new one;
PWM Source	When PWM is chosen in the Trigger Source combo box in the Capture & Resolution group, the PWM Source can be from Isolated input , GPIO0 , or GPIO1 in this combo box et al. ;
Advanced page	Always enable software trigger When this button is checked, no matter whether Trigger Source is Software or Hardware , the software trigger buttons(Single , Loop , Multiple) are always enabled; If the Plan or Hardware is chosen in the Type combo box on the Options>Sequence page, the Multiple button will switch to Sequence button; The Sequence button will be enabled if a)the Software Trigger Source is chosen in the Capture & Resolution group or b) the Always enable software trigger checkbox is checked on the Options>Advanced property page, in this case, both the Plan and Hardware Sequence captures are supported;
	UART There is a serial port function on the Advanced page, which can be used to communicate with external devices via serial port. Check Enable to enable this function. When enabled, GPIO0 and GPIO1 can only be used as UART transfers; The Baud Rate support 9600-115200. Cable Select can configure GPIO0 and GPIO1 , which can be configured as TX or RX respectively. Setting a value at TX , clicking Send to send the set value out; click Accept at RX to receive the value from the external device;
	Shutter Mode Enabled if the camera support. Users can select Rolling Shutter or Global Reset ;
	Exposure Active Mode Enabled if the camera support. Users can select Specified lines or Common exposure time ;
	Exposure Start Line Enabled when Specified lines in the Exposure Active Mode combo box is selected. To configure when the Exposure Active signal is valid;
	Exposure End Line Enabled when Specified lines in the Exposure Active Mode combo box is selected. To configure when the Exposure Active signal is invalid;

9.4 Cooling

There is a **Cooling** group on the left sidebar in ToupView. To enable the **Cooling** function, an external 12V power supply is required. By default, the **TEC** is turned on. One can set the **Target Temperature**. After entering the value, click "**Apply**", and the sensor temperature will gradually approach to the **Target Temperature**. At the same time, ToupView can display the current temperature in real time. And the cooling effect can reach about 10-25 degrees lower than the ambient temperature, as shown in Figure 56.

Figure 58 TEC settings

The Fan has two gears from Off to High. When High, the Fan speed reaches the highest. When Off, the Fan is turned off, the TEC is also turned off, and the power is 0, as shown in Figure 57.

Figure 59 Fan settings

When the TEC is turned on, the Fan will automatically turn on preventing the abnormal situation such as the housing temperature is too high if the Fan stops running when the TEC is working; when the Fan is turned off, the TEC will automatically turn off.

9.5.3 Introduction to SDK content

ToupCam series cameras support a variety of APIs, including: Native C/C++, .NET/C#/VB.NET, Python, Java, DirectShow, Twain, LabView, Matlab, etc. Compared with other APIs, Native C/C++ API as a low-level API is characterized by using pure C/C++ development without relying on other runtime libraries. The interface is simple and the control is flexible. This SDK zip package contains all the resources and information needed. The directory is

as follows:

- inc:
toupcam.h, the C/C++ header file.
- win: Microsoft Windows platform file

They can be applied for Dynamic library files of WinRT/ UWP (Universal Windows Platform)/ Windows Store App. They are compatible with Windows Runtime and can be referenced by Universal Windows Platform apps. If you use C# to develop UWP, you can use the toupcam.cs wrapper class.
Please pay attention to the Device Capability of uwp. Refer to how to add USB device capabilities to the app manifest. (Microsoft seems to limit the Device entry under DeviceCapability to no more than 100) demouwp.zip is a simple example of uwp. Please modify vid and pid. under DeviceCapability in the file Package.appxmanifest before compiling the run example.
- Drivers: (Cameras produced after 2017.1.1 support WinUSB, and drivers no longer need to be installed on Windows 8 and above)
The x86 folder contains the x86 kernel-mode driver files, including toupcam.cat, toupcam.inf and toupcam.sys.
The x64 folder contains the x64 kernel-mode driver files, including toupcam.cat, toupcam.inf and toupcam.sys.

10 CameraLink Camera Application

10.1 Connection to the CameraLink

Connect the two CameraLink cables: the CameraLink1 port on the camera is connected to the CL1 port on the capture card, the CameraLink2 port on the camera is connected to the CL2 port on the capture card.

Attention: if the camera and the acquisition card cross-linking, camera will not work. Please pay special attention.

10.2 Software installation

10.2.1 Install SDK

Windows 10 system can directly select the exe shown in Figure 58 to install SDK; For Windows 7, please install the driver shown in Figure 59.

10.6 The main features of camera

Function	Function description
Operating mode	Operating mode: video mode or trigger mode Trigger mode: soft trigger mode or external trigger mode
GenICam	Supports the standard GenICam protocol and can control the camera through third-party software

Serial port control	Support the virtual serial port of the CameraLink capture card to control the camera, and the camera command is open
Denoise	The camera hardware incorporates denoise
Bit depth	Built-in 14bit ADC, output 12bit or 14bit valid data
Automatic exposure	Automatic exposure or manual exposure function
Gain	HG, MG, LG 3 gain modes
Frame rate	Supports precise frame rate control
ROI	Supports single-zone ROI with a maximum frame rate of 8000fps after ROI
Flip	Supports Vertical/horizontal flip
Custom dark field correction	The hardware supports up to 12 groups of user-defined dark field correction image functions
Timestamp function	Timestamps can be turned on or off. After the timestamp function is enabled, the low 8bits of 1-8 pixels, 9-16 pixels, and 17-24 pixels will be modified to: 0-7: frame number; 8-15: Frame time; 16-23: trigger signal count
Firmware update	Supports firmware online update
Pipette function	Supports the display of the gray value of the mouse pixel position
Histogram display	Supports histogram display and statistics
Plane line function	Supports the function of viewing surface data
Regional gray statistics	Support the average gray statistics function of user-defined areas
DC12V power supply and cooling system	<p>1) When the DC12V power supply is disconnected and only the CameraLink cable is connected, the camera cannot work;</p> <p>2) Connect the 6PIN aviation plug interface of the DC12V adapter to the DC12V interface on the camera. After the power is successfully turned on, the two LED lights will light up;</p> <p>3) The cooling system of the camera is divided into TEC cooling sheets built in the sensor, using external heat dissipation structure and fan auxiliary heat dissipation, the working temperature can be adjusted to a specific value, the effective cooling temperature can be lower than the ambient temperature of 40°C, and the high-efficiency cooling system ensures extremely low dark current level;</p> <p>4) The TEC system adopts PID algorithm control, so that TEC can accurately adjust the sensor to the target temperature, and the temperature deviation is 0.3°C;</p>
Acquisition adaptation	Support mainstream brand CameraLink capture card, through the virtual serial port control, there are two ways: 1) The standard GenICam protocol is used to control the acquisition card software; 2) Capture card software is used to capture and display images, and CLCtrl software is used for control.

10.7 Camera Commands

10.7.1 Basic Formats

The serial port of the camera CameraLink is used as the communication port. The baud rate of the serial port is 115200, and the serial port has 8 bits without check bit mode.

The protocol format is compatible with GENICAM gencp 1.0. For details, refer to GENICAM protocol.

The protocol instruction is realized by register access, each function is distinguished and defined by different register addresses, and the protocol data is divided into general part and special part. The protocol data is preceded by the general part and followed by the special part. The general part is fixed to the length of 16 bytes, and the length of the special part is variable according to the different length of the function.

The general 16-byte format is described as follows (all fields in the general part are in Big-Endian format with high bytes before them) :

Suppose the sixteen bytes of data are D0, D1, D2, D3, D4, D5, D6, D7, D8, D9, D10, D11, D12, D13, D14, D15. For command execution, the protocol stipulates that the host computer is the active initiator and the device is the passive responder.

1. D0, D1 is two prefix bytes, fixed as 0x01 and 0x00.
2. D2 and D3 are the check words of the universal partial data. The check part ranges from D6, D7 to D14, and D15 adopts double-byte CRC redundancy check, with the high byte coming first (Big-Endian).
3. D4 and D5 are the check words for the total protocol data. The check part runs from D6 and D7 to the end of the entire protocol data. Double-byte CRC redundancy check is also adopted, with the high byte in the front (Big-Endian).
4. D6 and D7 are channel ids. At present, the device channel is fixed to 0, and the data is 0x00 and 0x00.
5. D8 and D9 are common flag fields. For the upper computer, if the value is 0x40, 0x01 indicates that the normal function request is sent and the device needs to respond. If the value is 0x00, 0x01 indicates that the

normal function request is sent and the device does not need to respond. For the response of the device, the field is 0x00. 0x00 indicates that the device receives the response correctly and there is no exception.

6. D10 and D11 are command ids, which are general command definition fields. For the upper computer, the values are 0x08 and 0x00 when reading data and 0x08 and 0x02 when writing data. For the device, the value is 0x08, 0x01 when it responds to read data, 0x08, 0x03 when it responds to write data.
7. D12, D13 indicates the length of the dedicated part data.
8. D14 and D15 are sequence ids. For the upper computer, the sequence ID needs to be increased by one for each command sent. The sequence ID remains the same for a device-side response to ensure that the host machine receives confirmation that the device-side instruction is executed correctly.

10.7.2 Dedicated Part Format

For the special part of the format is mainly divided into two read and write registers (register and length field is fixed in the Big-Endian format before the high byte, the rest of the data can be Big-Endian or Little-Endian, according to the custom)

1. Format description of the special part when the upper computer reads the register data

The whole dedicated data length is 12 bytes, if the data is R0, R1, R2, R3, R4, R5, R6, R7, X0, X1, X2, X3, where R0~R7 is the register address that needs to be read; X0, X1 is fixed to 0x00, 0x00; X2, X3 are the length of the data to be read (the length is the legal length defined by the register, and the length of each register is specified).

2. Format description of the special part when the device responds to the upper computer reading register data

The whole private data is the data that needs to be read, there are no other fields; The length varies according to the length of the data read, such as X1, X2, X3..... Xn; The length of the read data is n.

3. Format description of the special part of the upper computer when writing register data

When the upper computer writes register data, the special part of the data consists of two parts: register and data, such as R0, R1, R2, R3, R4, R5, R6, R7, X1, X2, X3..... Xn; R0 to R7 indicates the register address (REG_ADDR). X1 to Xn indicates the data to be written. The length of the data to be written is n, which is the legal length specified by the register.

4. Format description of the special part when the device responds to the host computer to write register data

When the device successfully writes data from the host computer, the dedicated data part of the device response is fixed as 0x00, 0x00, 0x00, 0x00.

10.7.4 Camera instruction example

Set the exposure time command:

01 00 B7 C8 91 E0 00 00 40 01 08 02 00 0C 00 28 00 00 00 00 20 00 02 00 00 00 03 E8

Set exposure time: 1000 = 0x03E8, sequence ID is 0x28, expressed as instruction 0x28 sent, which can always be 0.

Double-byte CRC redundancy check:

B7 C8 = !(00 00 + 40 01 + 08 02 + 00 0C + 00 28)

91 E0 = !(00 00 + 40 01 + 08 02 + 00 0C + 00 28 + 00 00 + 00 00 + 20 00 + 02 00 + 00 00 + 03 E8)

Read the exposure time command:

01 00 B7 E2 95 DE 00 00 40 01 08 00 00 0C 00 10 00 00 00 00 20 00 02 00 00 00 00 04

Here the sequence ID is 0x10

Read exposure time Return content:

01 00 F7 EA F7 22 00 00 00 00 08 01 00 04 00 10 00 00 00 C8

This returns 200us.

10.8 CL SDK & CLView application

10.8.1 CL SDK

The camera control supports two modes: 1) Controlled through private SDK development kit; 2) Controlled by GenICam interface.

10.8.2 CLView application

CLView software can achieve complete control of the camera, and open source to customers to use, while providing technical support.

Description of the main functions of CLView software:

Serial port control;
